StableUnit

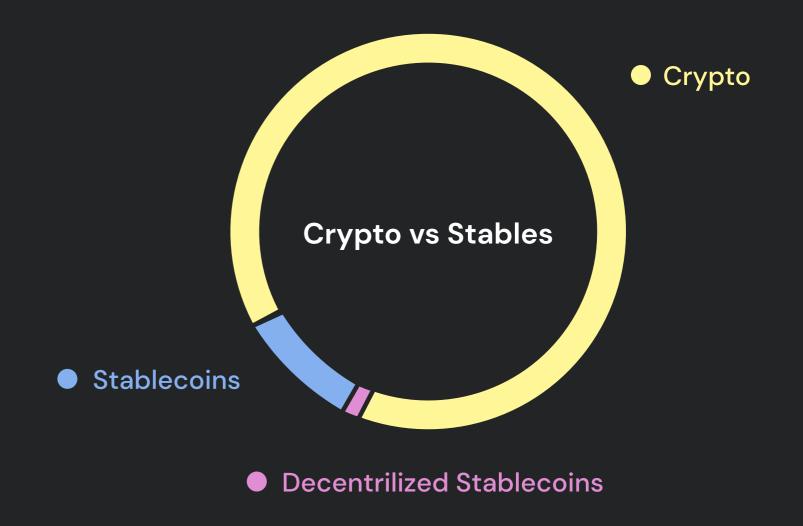

Stablecoin which earns yield while it's in your wallet

PROBLEM & BIG MARKET

Most of the \$170B value is in fiat-collateralized stablecoins like Tether and USDC. Decentralized stablecoins like DAI and sUSD make up only a small portion of the total supply, meaning the vast majority of stablecoins are centralized and can freeze funds at any moment.

Stablecoins are faster, programmable, and yield higher interest compared to the classical finance instruments. These advantages may result in substantial off-chain capital adoption on the blockchain. The market share of decentralized stablecoins is tiny compared to the whole market and is expected to grow significantly.

SOLUTION

Stablecoin which earns yield while it's in your wallet

StableUnit protocol is a censorship-resistant, CDP-based stablecoin (SUD) secured by capital-efficient DeFi assets like ETH and LP tokens.

HOW IS SUD STABILIZED?

SUD uses Multi-layer stabilization mechanism which is a stack of different stabilization methods used one by one if price fluctuation has exceeded.

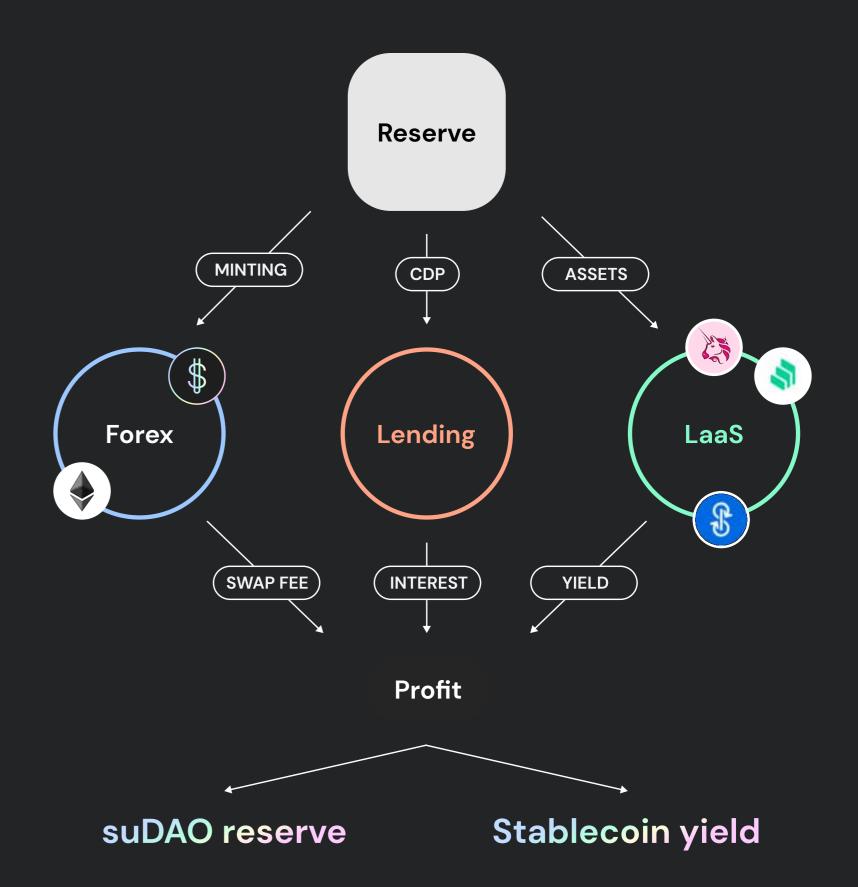

SCALABILITY & SAFETY

SUD unites the robustness of over-collateralized stablecoins, like DAI, with the scalability of algo-stablecoins without compromising decentralization and security.

CAPITAL EFFICIENCY

StableUnit ecosystem generates yield from liquidity as a service, forex and lending services. Unlike other stables, which leave assets in reserve idle, StableUnit puts those assets at work. Yields are automatically accrued in your wallet and compound daily. No staking, no lock-ups.
